

640k steps, square loss; every seed plotted, line is the median. Normalising by each arm's floor removes the 140x spread in where the curves end, so only the location of the drop distinguishes them. Points inside the transition: 0 of 7 at 32 bins, 2 at 64, 2 at 128, 4 at 256 — the grid is too coarse to place the threshold.
